1 Business Solution

1.1 Business Domain View

1.1.1 Problem Statement / Business Need

Item is the second message in the trade process following the Party message. Item elements are the mandatory attributes needed to align the item information between trading partners. These attributes in combination ensure the uniqueness of the data set associated with a GTIN. The use, definition, and relevance of these attributes is the same for ALL EAN.UCC industries. Following the Item attributes is an extension of cross industry. These are data attributes that may be required in conducting commerce between partners for the trade of an item or service. These attributes are relevant to more than one industry. The definition of these attributes must be the same for all industries.

Item and the extension of the cross industry data processes include communicating the data elements necessary to support the core business requirements in the global trading environment. The Party and Item process are mandatory in the completion of the price, purchase order, invoice, etc. messages that follow in the global trade process.

The objective of this document is to elaborate the Data Synchronization Data Model for Trade Item (hereafter referred to as 'Data Sync Trade Item') business process in enough detail to support the construction of standards. It is assumed that the players, both seller and buyer, have established a business understanding of the trading partner relationship. The challenge is to provide the core elements necessary to complete all supply chain processes without duplicates.

1.1.2 Objective

To supply the detail design of the (specific) business transaction needed to meet the requirements for Data Alignment.

1.1.3 Audience

The audience of the standards would be any participant in the global supply chain. This would include retailers, manufacturers, service providers and other third parties.

| Use Case Description | <p>There is only one scenario in the Item data communication process as described in problem statement of section 1.1. Item data alignment is the process of communicating the core item and cross industry data elements following the establishment of a business relationship between supplier, buyer or third party.</p> | | | | | | | | | | | | | | | | | | | | | | | |
| Actors (Goal) | <p>The two general players in the Data Sync Trade Item business process are the "seller" and the "buyer". Depending on the specific nature of the relationship other players may have a role, such as a Third Party. The graphic flow below pictures the core sequence of messages, and is expanded to account for additional scenarios.</p> <table border="1" data-bbox="513 1149 1383 1451"> <thead> <tr> <th>Actor's Name</th> <th>Description</th> <th>Buyer</th> <th>Seller</th> <th>3rd Party</th> </tr> </thead> <tbody> <tr> <td>Seller</td> <td>Manufacturer or supplier of the item.</td> <td></td> <td>X</td> <td>X</td> </tr> <tr> <td>Buyer</td> <td>Retailer or distributor of the item</td> <td>X</td> <td></td> <td>X</td> </tr> <tr> <td>Third Party</td> <td>Other parties that somehow influence the item and may include creation, distribution, publication, and/or maintenance of the item.</td> <td>X</td> <td>X</td> <td>X</td> </tr> </tbody> </table> | | | | Actor's Name | Description | Buyer | Seller | 3 rd Party | Seller | Manufacturer or supplier of the item. | | X | X | Buyer | Retailer or distributor of the item | X | | X | Third Party | Other parties that somehow influence the item and may include creation, distribution, publication, and/or maintenance of the item. | X | X | X |

| Performance Goals | | | | | | | | | | | | | | | | | | | | | | | | |
| Preconditions | <p>The buyer and seller must make contact and set up a business relationship before trade can proceed. This is a prerequisite to all of the other steps. This initial contact can be made in many different ways. Following the establishment of the trading agreement the parties must exchange their basic business data such as trading partner names, addresses, locations, item attributes, price lists, contracts and trading partner agreements. Specifically, the Core Item message follows the Core Party message in the data alignment process. This process creates a common understanding between the trading parties which can be used as a resource throughout the trading process.</p> <p>The Data Sync Trade Item business process begins when the parties decide to do business together. The next step is for the buyer to communicate the Party organizational information to the seller. The seller provides his Party organizational information to buyer. Other data alignment follows such as item and price attributes.</p> | | | | | | | | | | | | | | | | | | | | | | | |

| endAvailabilityDateTime | If the trade item is public only one date is valid per GTIN, GLN, TM combination. If Item is private there can be more than 1 value per TM. There is only one "end availability date" per GTIN/GLN/TM combination at any given time. In the case of seasonal trade items, only one start/end cycle can be in the data set version being synchronized. Therefore, a trade item cannot have multiple start/stop availability dates associated with it at any given time. Field is optional since most trade items are offered in an open ended environment. Is trading partner neutral for public trade items, trading partner dependent for private trade items. |

The old trade item identification specified in this field should be discontinued. |
| retailPriceOnTradeItem | As monetary amount field, this data element must be associated with a valid unit of measure. GTIN allocation rules state that price is not a relevant criterion for changing a GTIN except when the price is printed as a part of the trade item's packaging. |

| | startAvailabilityDateTime | If the trade item is public only one date (CCYY-MM-DDTHH:MM:SS) is valid per GTIN, GLN, TM combination. If Item is private there can be more than 1 value per TM. Needs to be earlier than "end availability date" This date indicates when the trade item can first be ordered by the buyer from the information provider. This date can be trading partner dependent if the trade item or service is defined as private. It is trading partner neutral if the trade item/service is public. It does not indicate when this trade item becomes available to the end consumer (see first sale date) There is only one start availability date per GTIN/GLN/TM combination. Date format is ISO8601 – CCYY-MM-DDTHH:MM:SS. |
| | storageHandlingTemperatureMaximum | When no other information is provided (temperatures to market or/and distribution centre), this value applies at any point of the supply chain. | | tradeItemIdentificationOfNextLowerLevelTradeItem (Represented as association of ChildTradeItem Class to TradeItemIdentification Class). | Allowed for more than 1 reference to lower levels to allow for the registration of Mixed Assortments. The sequence of entering GTINs is important when a next lower level GTIN is to be linked. The next lower level GTIN must already exist, therefore the order of trade items to be entered should be from lowest to highest e.g. consumer, then intermediate, then traded, etc. While there can be multiple child trade items, there can only be one trade item identification per child item. |
| | Variant | This is different from the Global Product Classification variant. Free form text field, this data element is repeatable for each language used and must be associated with a valid ISO language code. |
| | Width | Measurements are relative to the type of trade items being measured. There are two cases described by the GDSN Packaging Measurement Rules: consumer trade items and non consumer trade items. Make sure you use the right specifications. |

1.7.2 External Code Lists

There are several code lists used within the EAN•UCC system that are maintained by agencies other than EAN•UCC. The code lists that are reference in this section apply to several attributes within the trade item as well as other business message standards.

Language Code

The Trade Item BMS restricts the use to just the two character language code as specified in ISO 639-1; these codes are lower case.

ISO Code Lists

The following ISO codes lists are used to represent languages (for text attributes), Country and Subdivision (for country of origin and target market), and currencies (for amounts), and the source for the code list.

| | |
|------------|---|
| ISO 639-1 | Codes for the representation of names of languages -- Part 1:Alpha-2 code 2002 Available from: http://www.iso.ch or http://www.loc.gov/standards/iso639-2/langcodes.html#ef See Code List Source Bibliography section of this document. |
| ISO 3166-1 | Part 1 - Country Codes (Three Digit Format) Available from: http://www.iso.ch |
| ISO 3166-2 | Part 2 - Alpha Country Subdivision Code Available from: http://www.iso.ch |
| ISO 4217 | Codes for the representation of currencies and funds 2001 Available from: http://www.iso.ch |

EAN•UCC has three choices for code values:

Reference an external source like ISO.

Maintain a code list unique to the EAN•UCC system.

Maintain a code list based on an external code list.

Any code list EAN•UCC maintains will need to be accessible to the community and maintained in such a way as to be detached from the schema versioning. The end result is the code lists will be managed outside of the schemas in such a way to remain easy to update and allow for the syntax checking of code values as is done with enumerated lists.

Unit of Measure

The Unit of Measure (UOM) code is used throughout the EAN•UCC System. In order to provide the best value to the EAN•UCC community the UOM code list will be maintained by EAN•UCC for its community. It is anticipated additional code values will be required. When the business requirements are defined additional code values can be added. The following is the starting point.

|-------------------|---|--|
| | Code | Code Description |
| packagingTypeCode | Part of PackagingType class. It is String 1 to 3 characters. It would be a very large list to combine DE103 and DE7065 because DE103 is a two-part list. | |
| | Recommend using ANSI DE 103 Part 1 – Packaging Form and making it a EAN•UCC maintained code list. This seems to be more in-line with the intent of this attribute and packagingMaterialCode | |

1.7.3 Relationship to Global Data Synchronization process

The Data Sync Trade Item model was built keeping in mind the design of the data synchronization process being developed by the Data Sync Project Team under the Align Data BRG.

The key principle that is carried over from that work is the assumption that when a trade item's information is transmitted from an information provider to a data pool, and data pool to data pool (in network data synchronization) that the entire product hierarchy is transmitted. In the grocery industry, that product hierarchy will normally include item, case and pallet, and may also include other levels as listed above in section 4.1. A message detailing information about a trade item must include at least one consumable and one orderable unit. Included in this product hierarchy, it is understood that each link connecting the various levels is also considered to be a part of the message.
